

# Water Loss Control Program Development

May 21, 2015

**Moulton Niguel Water**

Leading the Way in Service

# Outline

- Initial Water Loss Assessment – 2013
- Water Assessment and Loss Management Approach
- Identifying Water Loss Components
- Deliverables
- Results
- Next Steps

# 2013 Water Loss Assessment

- Loss calculation approach – AWWA M36
- Customer Billing Data, Imported Metered, Exported Metered, Unmetered, Unbilled, and Operational Use Estimates

Water In	Water out					
	Billed Authorized			Unbilled Authorized		
1 <u>Volume From Own Sources</u>  (OC79 + OC81 + CM10 + SC2B)	4 <u>Water Exported</u>  (SJC, SCWD, ETWD)	5 <u>Billed Metered</u>  Domestic + Commercial minus Exported Water	6 <u>Billed Unmetered</u>  SCWD 920 Zone	7 <u>Unbilled Metered</u>  JRP, SOCWA, 3A, 2A Basins	8 <u>Unbilled Unmetered</u>  Flushing and VACCON Water Loss	14 <u>REAL LOSSES</u>  Line Breaks, Service Line Leaks, Sheared Hydrants, Over Flowing Tanks

# CY 2013 Water Loss Results

## January – December 2013:

Water Source Volume	= 29, 095 AF
<u>Consumption + Accounted-for-Losses</u>	<u>= 26, 363 AF</u>
<b>Estimated Water Losses (Apparent/Real)</b>	<b>= 2,732 AF</b>
	<b>= 9.4 % Water Loss</b>
Theoretical Unavoidable Real Losses	= 4.0 %
<b>Potentially Recoverable Water Losses</b>	<b>= 1,570 AF</b>

# Water Assessment and Loss Management Approach

- Expert Consultant - Water System Optimization (WSO)
- Develop Scope of Work
- Define Assessment Period
- Data Validation
- Prepare Tailored Water Balance Model – AWWA Water Audit
- Identify Non-Revenue Water Loss Components
- Develop Appropriate Water Loss Control Strategies

# Components of Water Balance

<b>WATER SUPPLIED</b>	<b>Authorized Consumption</b>	<b>Billed Authorized Consumption</b>	<b>Billed Metered Authorized Consumption</b>	<b>REVENUE WATER</b>	
			<b>Billed Unmetered Authorized Consumption</b>		
		<b>Unbilled Authorized Consumption</b>	<b>Unbilled Metered Authorized Consumption</b>		
			<b>Unbilled Unmetered Authorized Consumption</b>		
	<b>Water Losses</b>	<b>Apparent Losses</b>	<b>Consumption metering errors</b>		
			<b>Unauthorized consumption</b>		
		<b>Real Losses</b>	<b>Leakage/overflow at service reservoirs</b>		
			<b>Leakage from trunk mains</b>		
			<b>Leakage from distribution mains</b>		
			<b>Leakage from service connections</b>		

# Revenue Water

<b>WATER SUPPLIED</b>	<b>Authorized Consumption</b>	<b>Billed Authorized Consumption</b>	<b>Billed Metered Authorized Consumption</b>	<b>REVENUE WATER</b>
			<b>Billed Unmetered Authorized Consumption</b>	
	<b>Authorized Consumption</b>	<b>Unbilled Authorized Consumption</b>		<b>Unbilled Metered Authorized Consumption</b>
				<b>Unbilled Unmetered Authorized Consumption</b>
	<b>Water Losses</b>	<b>Apparent Losses</b>		<b>Consumption metering errors</b>
				<b>Unauthorized consumption</b>
		<b>Real Losses</b>		<b>Leakage/overflow at service reservoirs</b>
				<b>Leakage from trunk mains</b>
			<b>Leakage from distribution mains</b>	
			<b>Leakage from service connections</b>	

# Non-Revenue Water

<b>WATER SUPPLIED</b>	<b>Authorized Consumption</b>	<b>Billed Authorized Consumption</b>	<b>Billed Metered Authorized Consumption</b>	<b>REVENUE WATER</b>	
			<b>Billed Unmetered Authorized Consumption</b>		
		<b>Unbilled Authorized Consumption</b>	<b>Unbilled Metered Authorized Consumption</b>		<b>NON REVENUE WATER</b>
			<b>Unbilled Unmetered Authorized Consumption</b>		
	<b>Water Losses</b>	<b>Apparent Losses</b>	<b>Consumption metering errors</b>		
			<b>Unauthorized consumption</b>		
		<b>Real Losses</b>	<b>Leakage/overflow at service reservoirs</b>		
			<b>Leakage from trunk mains</b>		
			<b>Leakage from distribution mains</b>		
			<b>Leakage from service connections</b>		

# Revenue Optimization

<b>WATER SUPPLIED</b>	<b>Authorized Consumption</b>	<b>Billed Authorized Consumption</b>	<b>Billed Metered Authorized Consumption</b>	<b>REVENUE WATER</b>	
			<b>Billed Unmetered Authorized Consumption</b>		
		<b>Unbilled Authorized Consumption</b>		<b>Unbilled Metered Authorized Consumption</b>	<b>NON REVENUE WATER</b>
				<b>Unbilled Unmetered Authorized Consumption</b>	
	<b>Water Losses</b>	<b>Apparent Losses</b>		<b>Consumption metering errors</b>	
				<b>Unauthorized consumption</b>	
		<b>Real Losses</b>		<b>Leakage/overflow at service reservoirs</b>	
				<b>Leakage from trunk mains</b>	
			<b>Leakage from distribution mains</b>		
			<b>Leakage from service connections</b>		

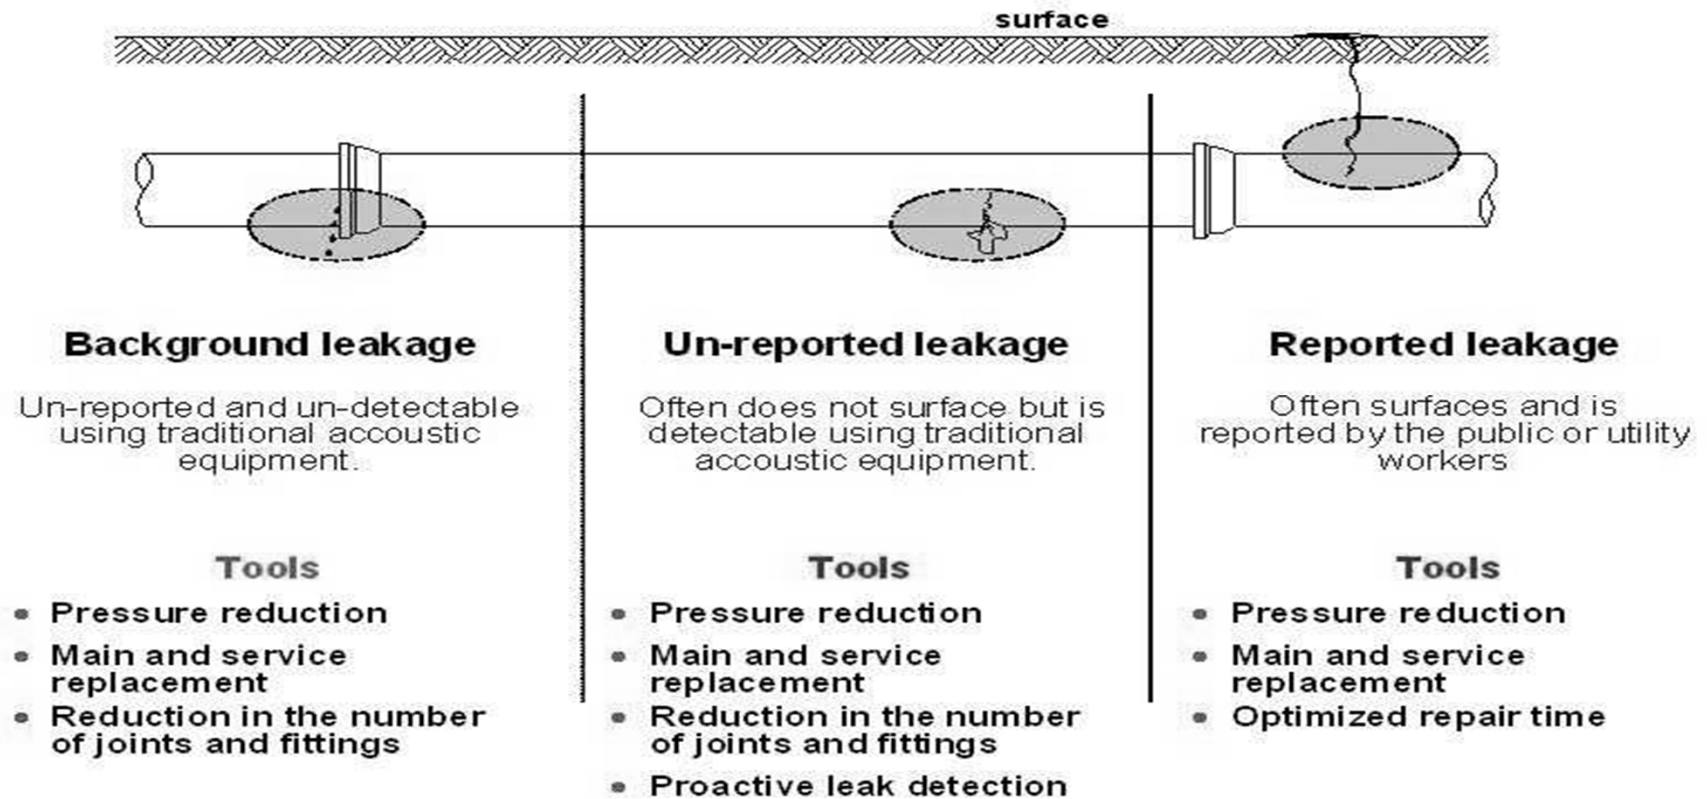

*REVENUE OPTIMIZATION*

# Real Loss Reduction

<b>WATER SUPPLIED</b>	<b>Authorized Consumption</b>	<b>Billed Authorized Consumption</b>	<b>Billed Metered Authorized Consumption</b>	<b>REVENUE WATER</b>	
			<b>Billed Unmetered Authorized Consumption</b>		
		<b>Unbilled Authorized Consumption</b>	<b>Unbilled Metered Authorized Consumption</b>		<b>NON REVENUE WATER</b>
			<b>Unbilled Unmetered Authorized Consumption</b>		
	<b>Water Losses</b>	<b>Apparent Losses</b>	<b>Consumption metering errors</b>		
			<b>Unauthorized consumption</b>		
		<b>Real Losses</b>	<b>Leakage/overflow at service reservoirs</b>		
			<b>Leakage from trunk mains</b>		
			<b>Leakage from distribution mains</b>		
			<b>Leakage from service connections</b>		

*REAL LOSS REDUCTION*

# Understanding The Components of Real Losses

# Deliverables

1. Tailored Water Balance Worksheet
  - Water Supplied
  - Authorized Consumption
  - Apparent Loss (Meters) Determination
  - Real Loss Determination
  - Component Analysis Summary
2. Data Collection Protocols and Training
3. Final Tech Memo
  - Results
  - Water Loss Control Recommendations

# Water Balance Results – FY2014/15

<b>WATER SUPPLIED</b> 29,051 AF (100 %)	<b>AUTHORIZED CONSUMPTION</b> 26,630 AF (91.7 %)	<b>BILLED AUTHORIZED CONSUMPTION</b> 26,588 AF (91.5 %)	<b>REVENUE WATER</b> 26,588 AF (91.5 %)
		<b>UNBILLED AUTHORIZED CONSUMPTION</b> 42 AF (0.1 %)	<b>NON-REVENUE WATER</b> 2,463 AF (8.5 %)
	<b>WATER LOSSES</b> 2,421 AF (8.3 %)	<b>APPARENT LOSSES</b> 196 AF (0.7 %)	
		<b>REAL LOSSES</b> 2,225 AF (7.7 %)	

# Water Assessment Recommendations

1. Adoption of Current Industry Standards for Monitoring
2. Continue to Employ Water Data Collection Best Practices
3. Employ “Real Loss” Reduction Strategies
  - Develop and Implement a “Zonal” Leak Detection Pilot Program
  - Conduct Thorough Distribution System Pressure Study
  - Implement Districtwide and Ongoing Leak Detection Program
4. Continue to Collect Data and Monitor Water System Losses

# Questions?

# Research Partnership on Rebate Program Incentives

May 18, 2015

# Outline

- Rebate Program Background
- Study Objectives
- Study Benefits to MNWD
- Demand Management Literature Overview
- UCR Past Water Agency Research Partnerships
- Proposal Overview
- Process & Outputs

# Rebate Program Background

- Approximately \$5.5 M committed to date since Nov. 2011
- Main Rebates (>95% of Total Funding):
  - Turf Removal
  - Synthetic Turf
  - High Efficiency Toilets
  - High Efficiency Washing Machines
- Turf Removal Residential Participation ~ 1% of customer accounts

# Study Objectives

- Determine impact of key demand drivers at the account level:
  - Income
  - Education
  - Irrigation Area
  - Household Size
  - Weather
  - Price of Water
  - Rebate Funding
  - Rebate Marketing
- Determine funding & marketing level to get customers to participate in rebate programs

External forces

Policy Levers to Impact  
Water Demand

# Study Benefits to MNWD

- Understanding of rate structure impacts for District customers at individual account level
- Water savings of each program & cost/benefit based on District's unique customer base
- Optimize rebate participation & water savings at lowest cost for District customers
  - Incentive level to set each rebate program supported by independent institution (UC Riverside)
  - Recommendation on marketing strategy based on marketing research survey

## Pricing is an effective conservation tool

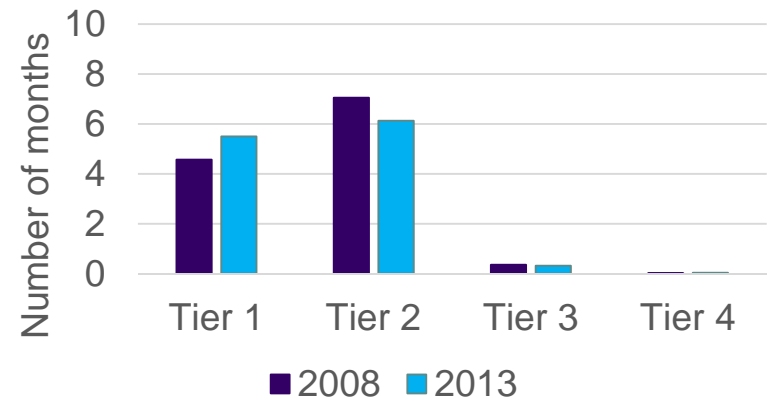

- Timmins (2003): 13 urban areas in California's Central Valley
  - *Pricing almost always more cost-effective than mandatory low-flow appliance regulations*
- Mansur and Olmstead (2007): 11 urban areas in U.S. and Canada
  - *Estimated cost of 2-day-per-week irrigation restrictions relative to a price-based approach: ~25% of a household's average water bill*
- Grafton and Ward (2008): Sydney, Australia
  - *Estimated cost of mandatory water restrictions relative to a price-based approach: ~50% of a household's average water bill*
- Baerenklau, Schwabe, and Dinar (2014): Eastern MWD
  - *Adoption of allocation-based rates reduced water use by 10-15% while raising the average price paid by only 3%*

## UCR study of Eastern's allocation-based rates

Demand reduction attributable to the allocation-based rate structure

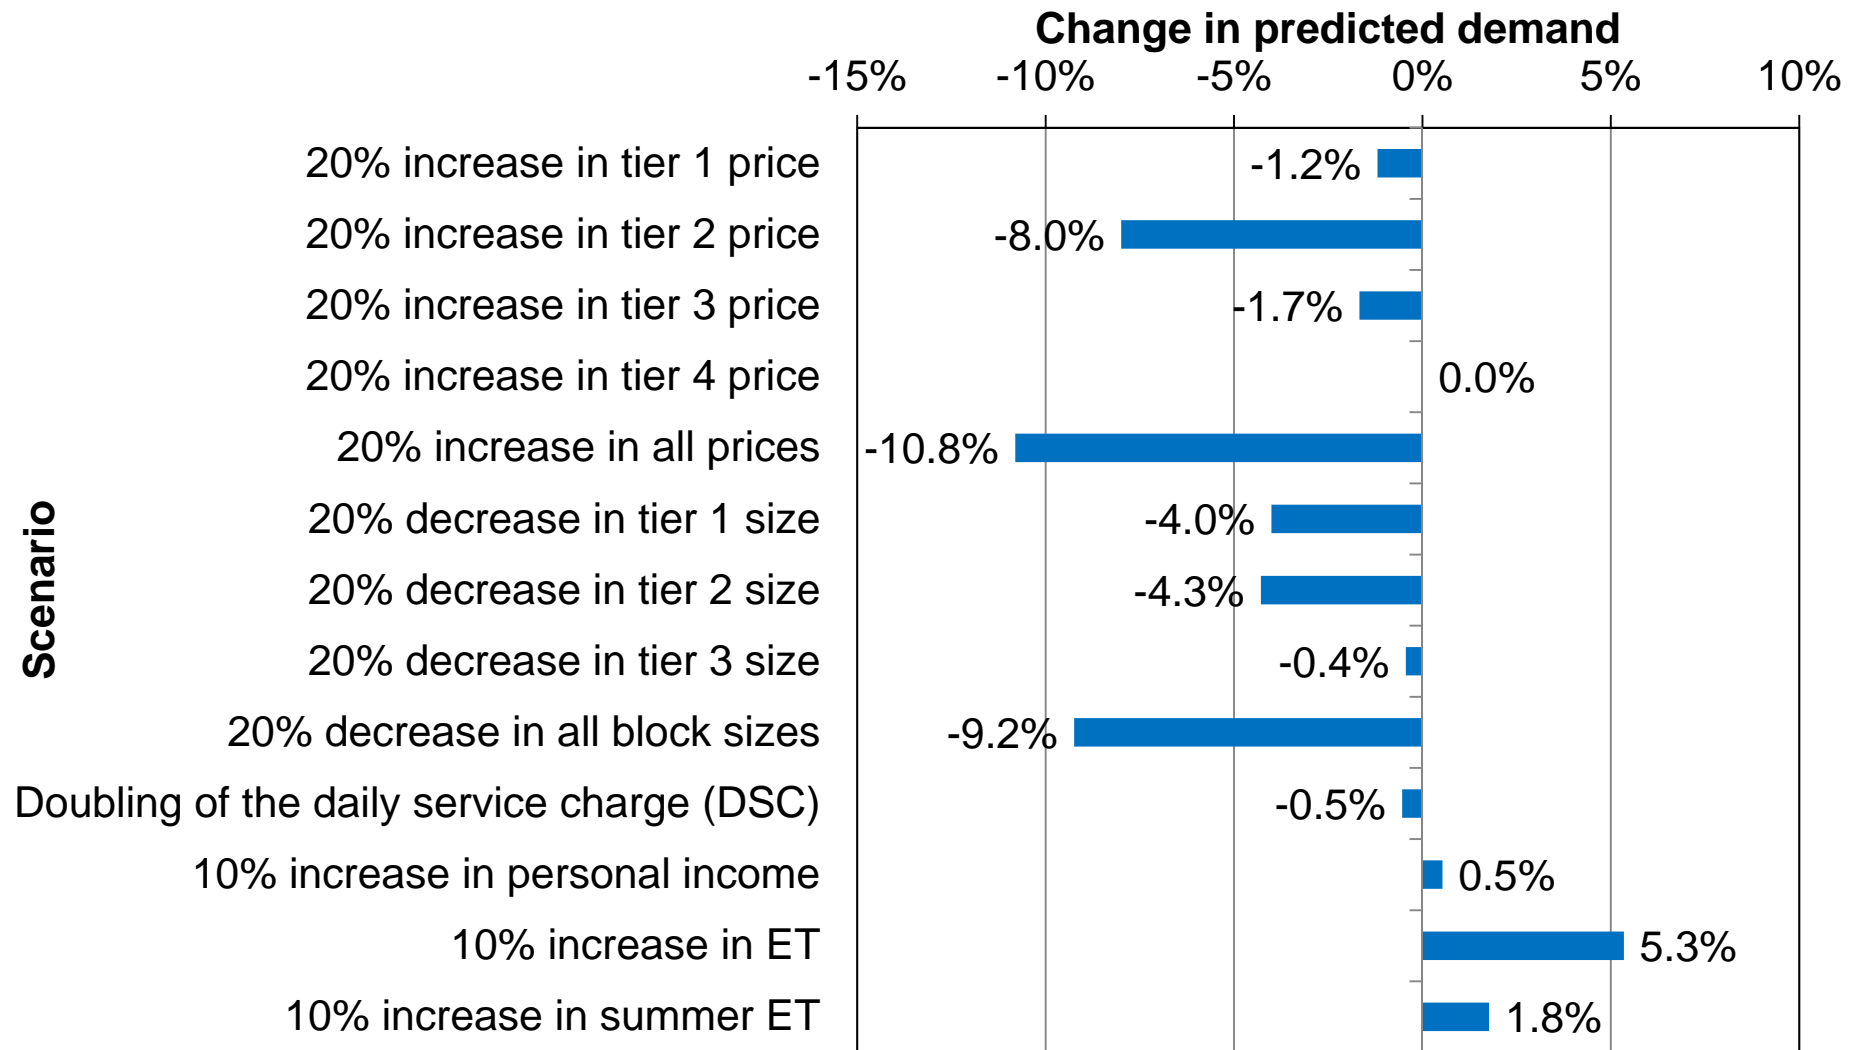

Efficient Households: 11.6 → 11.6

Inefficient Households: 3.4 → 8.6

## UCR study of Eastern's allocation-based rates

## Pricing is not without inherent drawbacks

- Increased costs are particularly challenging for disadvantaged households and local businesses
- Higher prices hurt customer perceptions and strain customer relationships

**Solution:** Couple pricing with conservation rebate programs

- Rebate programs make it easier for customers to reduce water use and exposure to high water bills
- Conservation programs are an important complement to pricing

## Conservation programs have unpredictable results

Observation: Savings are highly variable and usually less than expected

Examples: Low flow showerheads, low-flush toilets, front load washers, ...  
(Mayer et al. 1998; Olmstead & Stavins 2007; Schwabe et al. 2014)

Reasons:

- Behavioral response to incentives is hard to predict
- Engineering calculations typically do not consider behavior

Consequences:

- Rebates fail to produce high participation rates
- Customers do not use technologies as anticipated
- Cost per unit of water saved is higher than expected

## UCR study of high-efficiency sprinkler nozzle give-away

FreeSprinklerNozzles.com

Now Available with Pressure Compensation!

WITHOUT PCD      WITH PCD

Installation of water efficient nozzles dramatically reduces misting and decreases irrigation water usage by up to 30%

**When Should You Select the Pressure-Compensating Model?**

Both standard Toro® Precision™ Series spray nozzles as well as Pressure-Compensating models are available to all qualified participants in the FreeSprinklerNozzles.com Program. As a general guideline, residential customers should use the Pressure-Compensating nozzles. For commercial sites, standard Toro® Precision™ Series spray nozzles should be used if pressure regulators are present either on the spray heads or zone valves. Standard Precision™ Series spray nozzles should always be utilized in low-pressure situations.

Pressure-Compensating Models are easily identified by the embossed red Toro® logo.

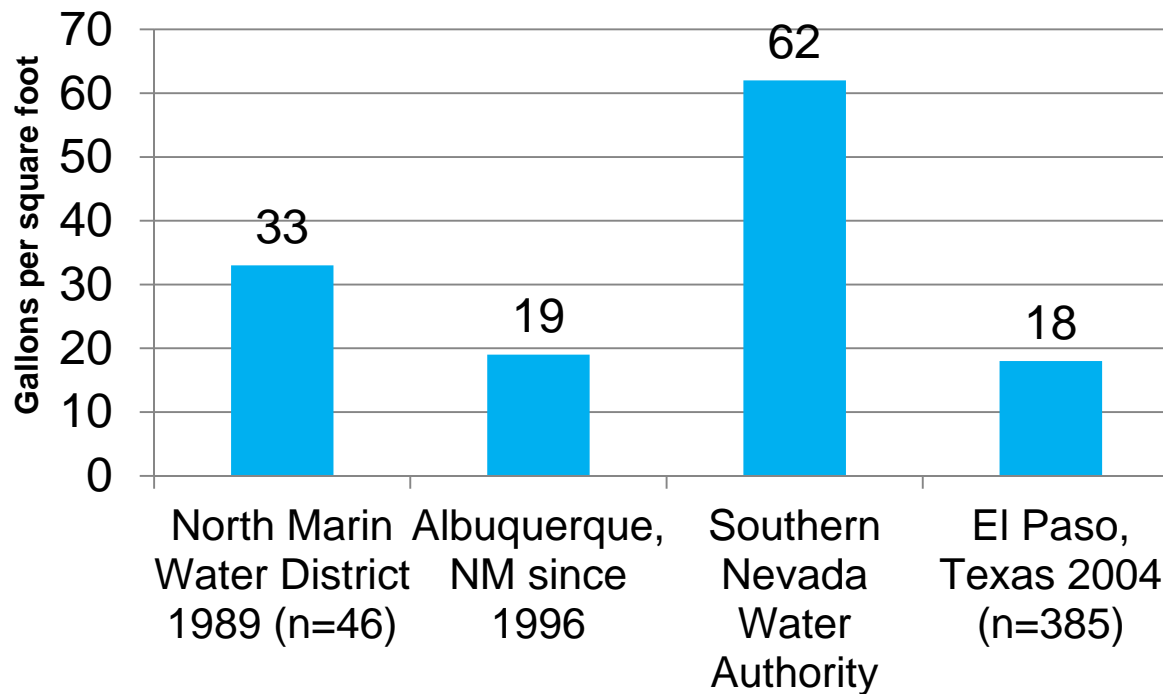

Figure 2. Water Use Pre- and Post-Phase II Program Period\*

1/3 of potential efficiency when installed

## Recent study of turf removal programs

Estimated Water Savings and Costs  
 (Addink 2014)

<b>Cost/AF:</b>	<b>\$512</b>	<b>\$718</b>	<b>\$532</b>	<b>\$1834</b>
-----------------	--------------	--------------	--------------	---------------

Did not require irrigation improvements

## Proposal

Develop more informed, targeted, and cost-effective conservation programs through a systematic analysis of:

- Factors that determine participation in conservation programs
- Factors that influence residential water demand
- Effectiveness of price and non-price conservation programs
- Revenue and cost implications of alternative conservation options
- Possible synergistic effects across conservation programs
- Agency-level revenues, costs, and water use

## **Phase I: Identification of drivers of program participation & water use**

### Questions addressed:

- What factors determine if a household participates in a conservation program?
- What factors influence residential household water use?

Available Data: Agency, Household (Census), Community, Biophysical Factors

### Deliverables (December 2015):

- Identification of role of agency, household-level, community factors
- Impact of alternative pricing structures on water demand
- Impact of conservation programs on household water bills & agency revenue and costs

## **Phase II: Survey of Consumer Preferences and Actions**

### **Questions Addressed:**

- **What are the full range of conservation actions households have adopted?**
- **How do customers feel about MNWD actions/strategies, state actions/strategies, and what are their water-related attitudes?**
- **What is the relative importance of different attributes of a conservation program (e.g., service, rebate levels, water savings)?**
- **Which outreach / media strategies seem most effective at reaching customers?**

### **Data Collection: Residential Household-level Survey and Choice Experiment**

### **Deliverables (September 2016):**

- **Summary of customer attitudes toward water use, MNWD, and conservation programs**
- **Summary of customer actions and participation in water conservation programs**
- **Comparison of survey data with MNWD customer records of program participation**

## **Phase III: Analysis of Water Conservation Drivers and Water Use**

### Questions Addressed:

- What are the main customer, agency, community, and environmental factors that influence conservation program participation and water use?
- How do different conservation programs compare in terms of cost effectiveness

### Data Collection: Combining Phase I and Phase II data and analyses

### Deliverables (March 2017):

- Analysis of how different program attributes (e.g. rebate levels, marketing, water rates) impact water conservation program participation and savings
- Analysis of cost-effectiveness of each program and extent of “additionality”
- Statistical analysis of the drivers of water demand accounting for conservation actions
- Comparison of conservation program revenue effects and operating costs

Thank you!
